

1. What is a Non-Automatic Weighing Instrument (NAWI)?
2. What is OIML R 76?
3. Why is OIML R 76 used for NAWI testing?
4. What is model approval?
5. What information is required about the manufacturer?
6. What instrument specifications need to be recorded?
7. What are the laboratory/environmental conditions?
8. What is the maximum capacity (Max)?
9. What is the minimum capacity (Min)?
10. What is the verification scale interval (e)?
11. What is the actual scale interval (d)?
12. What is the accuracy class of a NAWI?
13. What is the permissible maximum error?
14. How is the permissible error determined?
15. What is an increasing-load test?
16. What is a decreasing-load test?
17. What is the eccentricity test?
18. What is repeatability testing?
19. What is the tare test?
20. What is zero-setting verification?
21. What observations need to be recorded during testing?
22. How is compliance determined?
23. How is a test result marked Pass/Fail?
24. What validation checks should be performed on test data?
25. What photographs/supporting documents should be attached?
26. What information should be included in the generated test report?
27. How can test reports be stored and retrieved?
28. What should the test history contain?
29. How can the application handle revisions to OIML requirements?
30. What is the purpose of automatically generating the NAWI test report?
